CYBERSHIELD AI – DETECTING THREATS BEFORE YOU CLICK

Problem Statement

- Phishing attacks are increasing and often trick users through emails, messages, and fake websites URL.
- Existing systems fail to detect zero-day threats in real time, leading to data and financial loss.

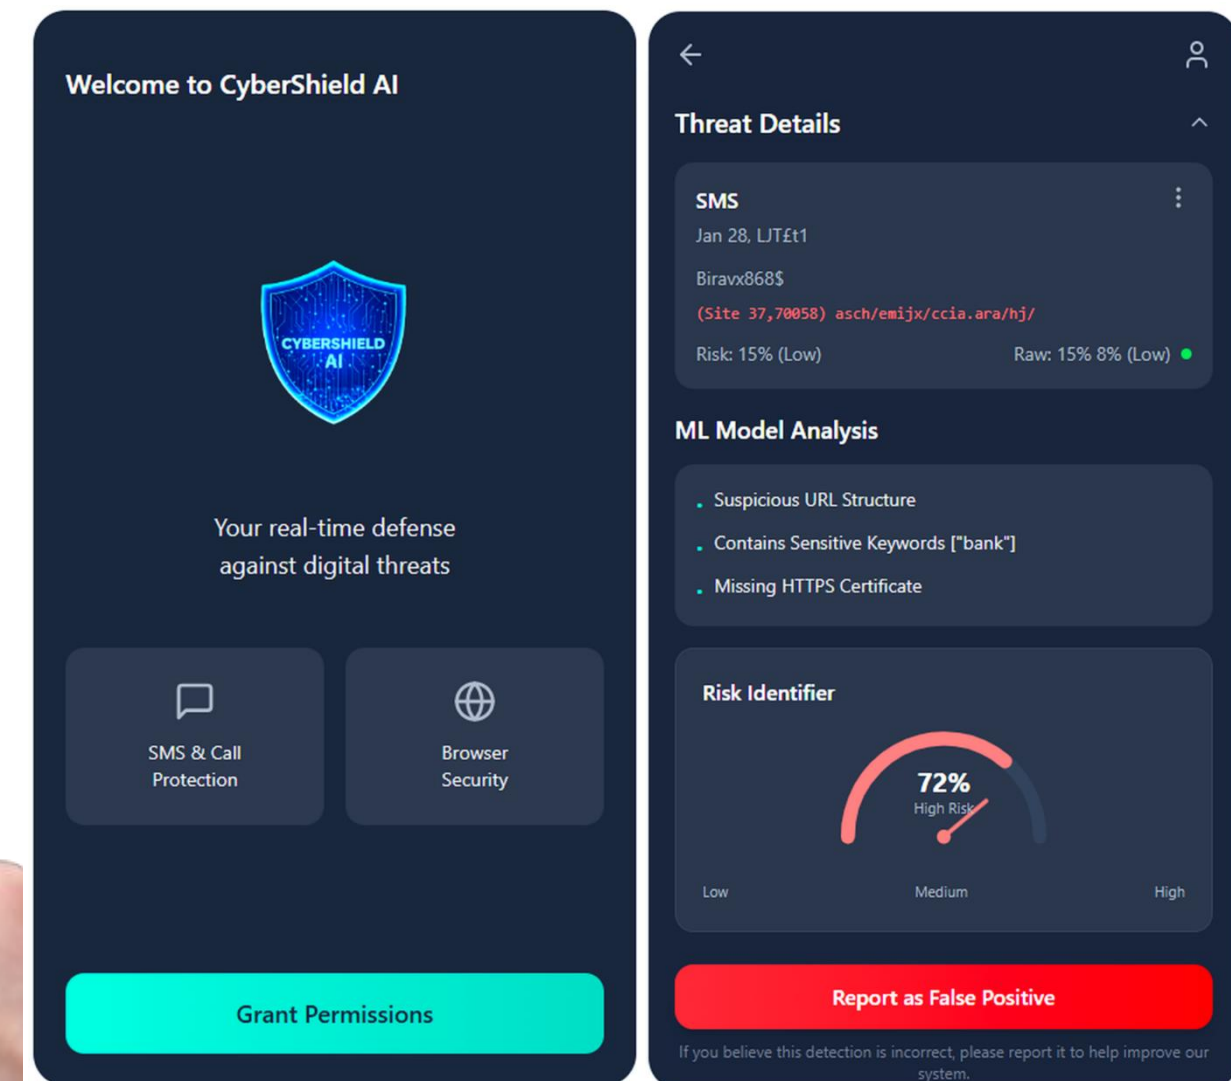

Proposed Solution

- We propose to develop a mobile application that automatically monitors incoming content like emails, SMS (including WhatsApp Chats), Phone Calls and URLs.
- An app is preferred because users won't manually paste content on websites; so protection must be automatic and real-time on the device

Key Features

- Real-time scanning of Emails, SMS, URLs, WhatsApp chats and notifications using APIs and NLP techniques.
- Phishing Detection using ML models like TF-IDF & Logistic Regression which helps to detect suspicious keywords and domains.
- CyberShield AI will give a phishing probability with simple reasons & able to classify phishing and legitimate content.
- Simple interface with a circular risk indicator showing phishing percentage, along with detected issues and reasons.
- System provides real-time alerts for harmful content through app notifications and can block it based on user preference.

Implementation Plan

Feasibility

- **CyberShield AI will Build as a mobile app so users don't have to copy and paste content into any website; protection is directly available on the device.**
- **System will support multiple input types like emails, SMS, URLs, WhatsApp chats, QR and files in one place.**
- **It works in real time to detect threats instantly before user interaction.**
- **Automatically analyses content without requiring manual effort.**
- **Provide Simple dashboard with a clear risk score and detected issues for easy understanding.**
- **No technical knowledge needed; simple and easy for any user to understand with Bi-language support (En, Hi).**
- **It designed to give accurate quick results with minimal false alerts.**
- **It can work with low or no internet for faster and reliable detection.**

Innovation

What Makes Our Solution Different

REAL-TIME PROTECTION BEFORE USER INTERACTION, NOT JUST AFTER DETECTION

A SINGLE UNIFIED APP INSTEAD OF SEPARATE TOOLS FOR EMAIL, URLS, AND MESSAGES

SUPPORTS MULTIPLE INPUT TYPES (EMAILS, SMS, WHATSAPP CHATS, URLS, QR CODES, FILES) IN ONE SYSTEM

AI-BASED DETECTION INSTEAD OF ONLY RELYING ON STATIC BLACKLISTS

OFFERS A SIMPLE RISK SCORE WITH CLEAR REASONS, MAKING IT EASY TO UNDERSTAND

FOCUSES ON AUTOMATIC DETECTION WITH NO MANUAL CHECKING REQUIRED

DESIGNED FOR A FAST, LIGHTWEIGHT, AND USER-FRIENDLY EXPERIENCE

Future Scope

- Integration with more platforms like social media apps (Instagram, Telegram) and browsers for wider protection.
- Advanced AI models to improve detection accuracy and handle new phishing techniques.
- Real-time voice call analysis for detecting scam calls.
- Cloud-based threat intelligence to update and share latest phishing patterns.
- Browser extension for secure web browsing (future enhancement).
- Multi-language support for wider user accessibility.
- Enterprise version for organizations with centralized monitoring.
